Strive for a 5: Preparing for the AP Environmental Science Exam

Princeton Review AP Environmental Science Prep 2021

Can we live with the consequences of wiping our closest relatives off the face of the Earth, and all the biological knowledge about ourselves that would die along with them? Extinction of the great apes threatens to become a reality within a few human generations. Stanford tells us how we can redirect the course of an otherwise bleak future.

5 Steps to a 5 AP Environmental Science, 2014-2015 Edition

Why do we do the things we do? Over a decade in the making, this game-changing book is Robert Sapolsky's genre-shattering attempt to answer that question as fully as perhaps only he could, looking at it from every angle. Sapolsky's storytelling concept is delightful but it also has a powerful intrinsic logic: he starts by looking at the factors that bear on a person's reaction in the precise moment a behavior occurs, and then hops back in time from there, in stages, ultimately ending up at the deep history of our species and its genetic inheritance. And so the first category of explanation is the neurobiological one. What goes on in a person's brain a second before the behavior happens? Then he pulls out to a slightly

larger field of vision, a little earlier in time: What sight, sound, or smell triggers the nervous system to produce that behavior? And then, what hormones act hours to days earlier to change how responsive that individual is to the stimuli which trigger the nervous system? By now, he has increased our field of vision so that we are thinking about neurobiology and the sensory world of our environment and endocrinology in trying to explain what happened. Sapolsky keeps going--next to what features of the environment affected that person's brain, and then back to the childhood of the individual, and then to their genetic makeup. Finally, he expands the view to encompass factors larger than that one individual. How culture has shaped that individual's group, what ecological factors helped shape that culture, and on and on, back to evolutionary factors thousands and even millions of years old. The result is one of the most dazzling tours de horizon of the science of human behavior ever attempted, a majestic synthesis that harvests cutting-edge research across a range of disciplines to provide a subtle and nuanced perspective on why we ultimately do the things we do for good and for ill. Sapolsky builds on this understanding to wrestle with some of our deepest and thorniest questions relating to tribalism and xenophobia, hierarchy and competition, morality and free will, and war and peace. Wise, humane, often very funny, *Behave* is a towering achievement, powerfully humanizing, and downright heroic in its own right.

5 Steps to a 5: AP Environmental Science 2021

Focusing on the remarkable similarity between chimp and human DNA, the author explores the role of molecular genetics, anthropology, and biology, and psychology in the human-ape relationship.

Details how, with the unprecedented opening of African forests by European and Asian logging companies, the traditional consumption of wild animal meat in Central Africa has suddenly exploded in scope and impact, moving from what was recently a subsistence activity to an enormous and completely unsustainable commercial enterprise. Although the three African great apes account for only about one percent of the commercial bush meat trade, today's rate of slaughter could bring about their extinction in the next few decades. Eating Apes documents the when, where, how, and why of this rapidly accelerating disaster. In bringing the facts of this crisis and these impending extinctions into a single, accessible book, Peterson takes us one step closer to averting one of the most disturbing threats to our closest relatives.--From publisher description.
