It was May 2013 when Thomas Paradis convened in Siena, Italy, with a cohort of American faculty and students to lead a two-month inaugural study-abroad program. After a harrowing journey across the ocean, students and faculty alike soon realized that adapting to a foreign culture and language would be more challenging than they expected, especially amid one of the world's more authentic community festivals—the Palio horse race. Paradis weaves witty stories of personal discovery with a crash course on Siena and its ferocious twice-yearly horse race. As the July 2 race and its related rituals draw closer, Paradis details how he and his wife uncovered the impressive local communities that underlie the life and blood of the age-old Palio in order to better understand what drives the passion of its residents. When the race finally begins, Paradis provides a compelling upfront view of the action and the race's aftermath, pulling in the collective experiences of his students as their eyes and minds open to seeing the world in an entirely new way. Living the Palio shares an amusing and instructional romp through Siena, Italy, as

university faculty members and their students gain self-confidence, patience, and most importantly, respect for a different way of life.

The light-duty vehicle fleet is expected to undergo substantial technological changes over the next several decades. New powertrain designs, alternative fuels, advanced materials and significant changes to the vehicle body are being driven by increasingly stringent fuel economy and greenhouse gas emission standards. By the end of the next decade, cars and light-duty trucks will be more fuel efficient, weigh less, emit less air pollutants, have more safety features, and will be more expensive to purchase relative to current vehicles. Though the gasoline-powered spark ignition engine will continue to be the dominant powertrain configuration even through 2030, such vehicles will be equipped with advanced technologies, materials, electronics and controls, and aerodynamics. And by 2030, the deployment of alternative methods to propel and fuel vehicles and alternative modes of transportation, including autonomous vehicles, will be well underway. What are these new technologies - how will they work, and will some technologies be more effective than others? Written to inform The United States Department of Transportation's National Highway Traffic Safety Administration (NHTSA) and Environmental Protection Agency (EPA) Corporate Average Fuel Economy (CAFE) and greenhouse gas (GHG) emission standards, this new report from the National Research Council is a technical evaluation of costs, benefits, and implementation issues of fuel reduction technologies for next-generation light-duty vehicles. Cost, Effectiveness, and Deployment of Fuel Economy Technologies for Light-Duty Vehicles estimates the cost, potential efficiency improvements, and barriers to commercial deployment of technologies that might be employed from 2020 to 2030. This report describes these promising technologies and makes recommendations for their inclusion on the list of technologies applicable for the 2017-2025 CAFE standards.
