Growing Information: Part I

IT systems have a high impact on organizations and businesses today and are a key to globalization. Evolution of complexity calls for changes in the way these systems are built and managed. As a consequence, a paradigm shift towards Model-Driven Engineering and Policy-Based Management can be observed, both aiming at a better management of complexity. A lot of human effort is still necessary to develop and operate complex systems. In this thesis, an innovative approach to reduce that effort is presented. Domain-specific models are used to describe the IT system and its behavior at a high level of abstraction initially. They are refined into technical representations at lower levels and finally transformed into event condition action policies. These executable policies define which actions must or must not be performed to achieve the objectives of the system. The refinement of models and the generation of policy implementations are both fully automated. As high-level changes are automatically materialized in the respective policies, system behavior can be adapted at runtime simply by changing the high-

level models. This allows to operate even complex systems without considering their technical details. Finally, the correctness of the refinement is proven with a relational algebra. The benefits of the approach are demonstrated and evaluated with two real-world case studies, dealing with the management of mobile networks and the calculation of bonus payments.

A Guided Tour of Relational Databases and Beyond

Reflecting the increased importance of the collaborations between radiation oncology and informatics professionals, *Informatics in Radiation Oncology* discusses the benefits of applying informatics principles to the processes within radiotherapy. It explores how treatment and imaging information is represented, stored, and retrieved as well as how this information relates to other patient data. The book deepens your knowledge of current and emerging information technology and informatics principles applied to radiation oncology so that all the data gathered—from laboratory results to medical images—can be fully exploited to make treatments more effective and processes more efficient. After introducing the basics of informatics and its connection to radiation oncology, the book examines the process of healthcare delivery in radiation oncology, the challenges of managing images in radiotherapy, and the burgeoning field of radiogenomics. It then presents teaching, clinical trials, and research tools and describes open access clinical imaging archives in radiotherapy, techniques for maximizing

information from multimodality imaging, and the roles of images in treatment planning. It also looks at how informatics can improve treatment planning, the safety and efficiency of delivery systems, image-guided patient positioning, and patient assessment. The book concludes with discussions on how outcomes modeling evaluates the effectiveness of treatments, how quality control informatics improves the reliability of processes, and how to perform quality assurance on the informatics tools. With contributions from a host of top international experts in radiation oncology, medical physics, and informatics, this book leads the way in moving the field forward. It encourages you to find new ways of applying informatics to radiation oncology and help your patients in their fight against cancer.

Informatics in Radiation Oncology

The vast majority of software applications use relational databases that virtually every application developer must work with. This book introduces you to database design, whether you're a DBA or database developer. You'll discover what databases are, their goals, and why proper design is necessary to achieve those goals. Additionally, you'll master how to structure the database so it gives good performance while minimizing the chance for error. You will learn how to decide what should be in a database to meet the application's requirements.
