This report describes the results of a study that was conducted to determine the performance characteristics of several pulse code modulation codes for serial high density digital recording using wideband analog recorder/reproducers. The major conclusions are: (1) The standard Inter-Range Instrumentation Group (IRIG) conditions for analog recording with bias are also nearly optimum for serial high density digital recording (HDDR) with bias when a wideband IRIG recorder/reproducer is used; (2) The 'best' codes for serial HDDR when wideband IRIG analog recorder/reproducers are used are BIPhi-L and RNRZ-L. The maximum 'reliable' bit packing density for BIPhi-L is 15 kb/in. The maximum 'reliable' bit packing density for RNRZ-L is 25 kb/in. The minimum 'reliable' reproduce bit rate for RNRZ-L is 200 kb/s. Fifteen appears to be a good choice of shift register length for the RNRZ-L randomizer; and (3) Bit error rates of 0.000001 or better are easily achieved when good quality wideband instrumentation tape, 50-mil track widths, and the maximum recommended bit packing densities are used. The 1980 edition of the Telemetry Standards (Range Commanders Council IRIG Document 106-80) included Serial HDDR Standards based on these conditions. (Author).

The purpose of this handbook is to give those people concerned with operation and maintenance of tape recorders a better understanding of the theories and techniques of magnetic recording. In addition, some practical considerations are offered relating to the application and limitations of the direct and FM recording processes. These considerations should be of value to the system designer in adapting magnetic recording to his system requirements. (Author).
