Quantitative Financial Economics

Now in its sixth edition, *The Economics of European Integration* is a timely and insightful text on this everchanging and controversial topic. This edition guides the students through the facts, theories, history, institutions, laws, politics and policies of the European Union, and how each of these play their role in European economics. Covering both the microeconomics and macroeconomics of European integration, this text is written for second and third-year undergraduates in economics as well as advanced undergraduates and graduate students in business, international affairs, European studies and political science.

Macroeconomics: A European Text

The new European edition of Mankiw's bestselling and highly readable text communicates the theories and models of macroeconomics in a concise and accessible way, with real-world examples, discussions and case studies. The text is fully updated with extensive coverage of the global financial crisis and in particular its impact on European economies.

Asset Prices, Booms and Recessions

Much has changed over the last decade in the world of central banking. Most central banks now see low and stable inflation

as their main, if not only, target and many have been granted unprecedented independence. Financial markets around the world have become considerably more integrated and, some say, prone to irrational exuberance. With more independence has come the need for more accountability and transparency. With the increased size and volatility of markets has come the need to carefully manage communication. Central bankers have delivered a high degree of price stability, but now communication is high on their list of concerns, while private bankers and the media devote ever more energy in outguessing the monetary authorities' next moves. These issues and more will be covered by this report, originally presented to a closed meeting of distinguished central and private-sector bankers, academics and representatives of major media, and revised in the light of their discussion.

PADRE : politically acceptable debt restructuring in the Eurozone

A collection of revised papers from the 'Multilateralizing Regionalism' conference, held at the WTO in September 2007.

The Economics of European Integration

Modern macroeconomics has been based on the paradigm of the rational individual capable of understanding the complexity of the world. This has created a very shallow theory of the business cycle in which nothing happens in the macroeconomy unless shocks occur from outside. Behavioural Macroeconomics: Theory and Policy uses a different paradigm. It assumes that individual agents experience cognitive limitations preventing them from having rational expectations. Instead these individuals use simple rules of behaviour. Behavioural Macroeconomics introduces rationality by allowing individuals to learn from their mistakes and to switch to the rules that perform better. It introduces the idea of endogenously generated "animal spirits" that drive the business cycle and are in turn influenced by it, and applies this model to shed new light on a number of important issues. It analyses the role of fiscal policy in stabilizing the economy while maintaining debt sustainability; expands the model to include a banking sector and show how banks amplify the booms and busts; and explains how animal spirits help to synchronize the business cycles across countries. The model set out in Behavioural Macroeconomics leads to very different policy implications from the mainstream macroeconomic model. It shows how policymakers have a responsibility to stabilize an otherwise unstable system.

Macroeconomics

The Macroeconomics of Developing Countries provides a comprehensive discussion of the exogenous factors and macroeconomic policies that affect the business cycle, long term growth, and distribution of income in developing countries. It examines countries dependent on natural resources and affected by supply rigidities in agriculture. They also feature dualistic markets, a large informal sector, rapid population growth, a vulnerable export sector, and chronic dependence on a volatile global finance. The Macroeconomics of Developing Countries uses these examples to analyse the impact of stabilization and adjustment politics on growth, inequality, and poverty. Despite the launch of the Sustainable Development Goals there is little consensus on how macroeconomic policies can be consistent with these objectives. The Macroeconomics of Developing Countries demonstrates that a critical application of standard models to developing countries can generate erroneous results and induce the adoption of incorrect policy. In order to address this, it discusses the key structural differences between advanced and developing countries in order to justify the construction of alternative models.

The Macroeconomics of Developing Countries

This is an examples-driven treatment of introductory economic dynamics for students with a basic familiarity of spreadsheets. Shone approaches the subject with the belief that true understanding of a subject can only be achieved by students themselves setting out a problem and manipulating it experimentally. Although all economics students now have access to spreadsheets, they are often used for little more than graphing economic data. This book encourages students to go several stages further and set up and investigate simple dynamic models. A web-site for students and instructors is included that contains an additional 100 questions for students and 100 for instructors.

Evolution

Building upon the considerable success of previous editions, Macroeconomics provides a comprehensive analysis of modern macroeconomics within both a European and a global context. Competing theoretical approaches are presented in a clear

Burda and Wyplosz have produced another excellent textbook, which will guide students through challenging and complex issues with clarity and simplicity. The excellent teaching and learning aids include chapter overviews, summaries of key concepts, end of chapter exercises, and suggestions for further reading accompanying each chapter. Transition and Economics

In mainstream economics, and particularly in New Keynesian macroeconomics, the booms and busts that characterize capitalism arise because of large external shocks. The combination of these shocks and the slow adjustments of wages and prices by rational agents leads to cyclical movements. In this book, Paul De Grauwe argues for a different macroeconomics model--one that works with an internal explanation of the business cycle and factors in agents' limited cognitive abilities. By creating a behavioral model that is not dependent on the prevailing concept of rationality, De Grauwe is better able to explain the fluctuations of economic activity that are an endemic feature of market economies. This new approach illustrates a richer macroeconomic dynamic that provides for a better understanding of fluctuations in output and inflation. De Grauwe shows that the behavioral model is driven by self-fulfilling waves of optimism and pessimism, or animal spirits. Booms and busts in economic activity are therefore natural outcomes of a behavioral model. The author uses this to analyze central issues in monetary policies, such as output stabilization, before extending his investigation into asset markets and more sophisticated forecasting rules. He also examines how well the theoretical predictions of the behavioral model perform when confronted with empirical data. Develops a behavioral macroeconomic model that assumes agents have limited cognitive abilities Shows how booms and busts are characteristic of market economies Explores the larger role of the central bank in the behavioral model Examines the destabilizing aspects of asset markets

Euro Adoption in Central and Eastern Europe: Opportunities and Challenges

In this sequel to the first Geneva Report on the World Economy, published twenty years ago, the same group of authors review changes in the global economy and the IMF over this two-decade interval. While they find that that the IMF has responded actively to the ongoing globalisation trend, they flag concerns about formidable new challenges. For example, there is a danger that the IMF's resources could be significantly reduced at the very time that effective crisis management requires additional funding. The growth of emerging market economies increasingly calls into question the current distribution of voting power within the institution. Regional monetary arrangements and bilateral currency swaps create an alternative to the multilateral order epitomised by the IMF, as evidenced by the Fund's diminished role in the euro area crisis and by the rise of China with its own network of economic and financial initiatives. To address these challenges, this report suggests a quick-disbursing emergency financing facility for countries with strong fundamentals that does not require prequalification; puts forward new ideas for the IMF's dealings with regional arrangements; and recommends major changes to IMF governance, including a high-level non-resident Board, elected using a tailored voting procedure, whose role

is to make the independent management team more accountable.

Macroeconomics

The transition from socialism to capitalism in former socialist economies is one of the main economic events of the twentieth century. Not only does it affect the lives of approximately 1.65 billion people, but it is contributing to a shift in emphasis in economics from standard price and monetary theory to contracting and its institutional environment. Economic research in transition shows not only that institutions matter but also how their evolution toward higher efficiency depends on initial conditions and on sustained political support. Unlike early policy literature on transition economics, which focused on the so-called Washington consensus, this book provides an overview of current research, analyzing issues raised by transition for which economic theorists and policy makers had no ready answers. It shows how research on transition contributes to our understanding of capitalism as an economic system and of the dynamics of large-scale institutional change. The book is divided into three parts. The first part looks at how large-scale reforms are decided dynamically through the political process. The second part looks at the general equilibrium and macroeconomic effects of liberalization in economies without preexisting markets. The third part looks at the economic behavior of firms in the transition from state to private ownership and compares the effects of privatization, restructuring, and financial reform. Although focused on transition economics, the discussions are relevant to topics in political economics, development, public economics, corporate finance, and micro- and macroeconomics.

The British National Bibliography

Floro Ernesto Caroleo and Francesco Pastore This book was conceived to collect selected essays presented at the session on "The Labour Market Impact of the European Union Enlargements. A New Regional Geography of Europe?" of the XXII Conference of the Italian Association of Labour Economics (AIEL). The session aimed to stimulate the debate on the continuity/ fracture of regional patterns of development and employment in old and new European Union (EU) regions. In particular, we asked whether, and how different, the causes of emergence and the evolution of regional imbalances in the new EU members of Central and Eastern Europe (CEE) are compared to those in the old EU members. Several contributions

in this book suggest that a factor common to all backward regions, often neglected in the literature, is to be found in their higher than average degree of structural change or, more precisely, in the hardship they experience in coping with the process of structural change typical of all advanced economies. In the new EU members of CEE, structural change is still a consequence of the continuing process of transition from central planning to a market economy, but also of what Fabrizio et al. (2009) call the “second transition”, namely that related to the run-up to and entry in the EU.

Econometrics For Dummies

This graduate textbook is a primer in macroeconomics. It starts from essential undergraduate macroeconomics and develops the central topics of modern macroeconomic theory in a simple and rigorous manner. All topics essential for first year graduate students are covered. These include rational expectations, intertemporal dynamic models, exogenous and endogenous growth, nonclearing markets and imperfect competition, uncertainty, and money. The book also covers real business cycles and dynamic stochastic general equilibrium models, integrating growth and fluctuations, sticky wages and prices, consumption and investment, and unemployment. Lastly, it studies government policy, stabilization, credibility, and the connections between politics and the macroeconomy. Each topic is presented in the simplest model possible while still delivering the relevant answers and keeping rigorous foundations throughout the book. To make the book fully self-contained there is a mathematical appendix that gives all necessary mathematical results.

Carlin and Soskice integrate the financial system with a model of the macro-economy. In doing this, they take account of the gaps in the mainstream model exposed by the financial crisis and the Eurozone crisis. This equips the reader with a realistic modelling framework to analyse the economy both in crisis times and in periods of stability.

It addresses the question of why labour market outcomes have been disappointing during the transition, and suggests policy interventions to promote firms' investment, job creation and economic development.

Foundations of Modern Macroeconomics

Inflation is regarded by the many as a menace that damages business and can only make life worse for households. Keeping it low depends critically on ensuring that firms and workers expect it to be low. So expectations of inflation are a key influence on national economic welfare. This collection pulls together a galaxy of world experts (including Roy Batchelor, Richard Curtin and Staffan Linden) on inflation expectations to debate different aspects of the issues involved. The main focus of the volume is on likely inflation developments. A number of factors have led practitioners and academic observers of monetary policy to place increasing emphasis recently on inflation expectations. One is the spread of inflation targeting, invented in New Zealand over 15 years ago, but now encompassing many important economies including Brazil, Canada, Israel and Great Britain. Even more significantly, the European Central Bank, the Bank of Japan and the United States Federal Bank are the leading members of another group of monetary institutions all considering or implementing moves in the same direction. A second is the large reduction in actual inflation that has been observed in most countries over the past decade or so. These considerations underscore the critical – and largely underrecognized – importance of inflation expectations. They emphasize the importance of the issues, and the great need for a volume that offers a clear, systematic treatment of them. This book, under the steely editorship of Peter Sinclair, should prove very important for policy makers and monetary economists alike.

Macroeconomics

We contribute to the intense debate on the real effects of fiscal stimuli by showing that the impact of government expenditure shocks depends crucially on key country characteristics, such as the level of development, exchange rate regime, openness to trade, and public indebtedness. Based on a novel quarterly dataset of government expenditure in 44 countries, we find that (i) the output effect of an increase in government consumption is larger in industrial than in developing countries, (ii) the fiscal multiplier is relatively large in economies operating under predetermined exchange rate but zero in economies operating under flexible exchange rates; (iii) fiscal multipliers in open economies are lower than in closed economies and (iv) fiscal multipliers in high-debt countries are also zero.

An Introduction to Economic Dynamics

Learn more about the transitional economies of Central and Eastern Europe! This book examines the economic dynamics of Central and Eastern European post-Communist countries. It illuminates the paths these countries are taking toward restructuring their markets, increasing international trade, and bettering their connections with the European Union and other countries. Beginning with a comparative analysis of the three “P-governments”—Pigouvian, Partizan, and Paternalistic—and continuing with a discussion of the interrelated political and economic difficulties of transition, author Bruno Sergi proposes a surprising solution. Inspired by the Bruxelles consensus, he proposes that the European Commission should become a fourth “P-government,” replacing the role formerly played by the Washington consensus in the restructuring of post-Communist economies. Economic Dynamics in Transitional Economies also explores: regional comparative macroeconomics the aftereffects of the Washington Consensus integration of Eastern and Western European economies interrelations between national and regional monetary activity political and economic policy reform involvement of European Union member countries We are living in historic times, and Economic Dynamics in Transitional Economies will be a welcome guide to the rough roads ahead. This thorough assessment of current political and economic realities will stimulate debate about new European paradigms, the role of the European Union, and the difficulties of post-Communist transition. These issues promise to be vital to the region’s success in the new century.

IMF Reform: The Unfinished Agenda

The study of macroeconomics can seem a daunting project. The field is complex and sometimes poorly defined and there are a variety of competing approaches. It is easy for the senior bachelor and starting master student to get lost in the forest of macroeconomics and the mathematics it uses extensively. Foundations of Modern Macroeconomics is a guide book for the interested and ambitious student. Non-partisan in its approach, it deals with all the major topics, summarising the important approaches and providing the reader with a coherent angle on all aspects of macroeconomic thought. Each chapter deals with a separate area of macroeconomics, and each contains a summary section of key points and a further reading list. Using nothing more than undergraduate mathematical skills, it takes the student from basic IS-LM style macro models to the state of the art literature on Dynamic Stochastic General Equilibrium, explaining the mathematical tricks used where they are first introduced. Fully updated and substantially revised, this third edition of Foundations of Modern Macroeconomics now includes brand new chapters covering highly topical subjects such as dynamic programming, competitive risk sharing equilibria and the New Keynesian DSGE approach.

Eight central and eastern European countries--the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Slovak Republic, and Slovenia--officially joined the European Union (EU) in May 2004. This auspicious milestone marked the beginning of the next major step for these countries in their move toward full integration with the EU--adoption of the euro. Seeking to consider the opportunities and challenges of euro adoption, the papers in this volume--by a noted group of country officials, academics, representatives of international institutions, and market participants--offer insight on the various dimensions of euro adoption in these eight new EU members--how they should prepare, whether an early move is optimal, and what pitfalls may occur along the way.

The financial market melt-down of the years 2007-2009 has posed great challenges for studies on financial economics. This financial economics text focuses on the dynamic interaction of financial markets and economic activity. The financial market to be studied here encompasses the money and bond market, credit market, stock market and foreign exchange market; economic activity includes the actions and interactions of firms, banks, households, governments and countries. The book shows how economic activity affects asset prices and the financial market, and how asset prices and financial market volatility and crises impact economic activity. The book offers extensive coverage of new and advanced topics in financial economics such as the term structure of interest rates, credit derivatives and credit risk, domestic and international portfolio theory, multi-agent and evolutionary approaches, capital asset pricing beyond consumption-based models, and dynamic portfolio decisions. Moreover a completely new section of the book is dedicated to the recent financial market meltdown of the years 2007-2009. Emphasis is placed on empirical evidence relating to episodes of financial instability and financial crises in the U.S. and in Latin American, Asian and Euro-area countries. Overall, the book explains what researchers and practitioners in the financial sector need to know about the financial-real interaction, and what practitioners and policy makers need to know about the financial market.
