discipline due to specific issues of drug absorption, metabolism, distribution and excretion. The aim of this book is to improve understanding in all aspects of paediatric prescribing, from the development of suitable drugs through to their practical administration. With its origins in the EU-funded Global Research in Paediatrics (GRiP) project this is the first truly international textbook to provide guidance on the principles behind optimal neonatal and paediatric prescribing. Harnessing the international expertise of paediatricians and pharmacists in the field, *Prescribing Medicines for Children* compliments the British National Formulary for Children (BNFC), facilitating translation of essential pharmacological principles into good prescribing practice. It incorporates specific information on how to promote safe and effective prescribing in paediatrics, including how to avoid medication errors and adverse drug reactions in children. Highlights include the differences in prescribing habits between countries and the shared principles that underpin rational prescribing in paediatrics and neonatology. The book is divided into two sections: Section A provides concise educational material relating to paediatric pharmacology and optimising how medicines are developed and prescribed for children. Section B considers key clinical prescribing areas and can be used as a quick reference guide. Each chapter is focused on the key issues in prescribing for a respective clinical specialty or context. *Prescribing Medicines for Children* is essential reading for all those who are involved in prescribing medicines to neonates and children. This includes undergraduate and postgraduate pharmacists, nurses, paediatricians

interactions. In the remaining chapters, the book covers a definitive collection of topics containing essential information on the basic principles of pharmacology and how they are employed for the treatment of diseases. Readers will learn about special topics in pharmacology that are hard to find elsewhere, including issues related to environmental toxicology and the latest information on drug poisoning and treatment, analytical toxicology, toxicovigilance, and the use of molecular biology techniques in pharmacology. The book offers a valuable resource for researchers in the fields of pharmacology and toxicology, as well as students pursuing a degree in or with an interest in pharmacology.

### **The Extra Pharmacopoeia**

This fascinating book will be enjoyed both by those interested in the science of poisons and also by general readers who can dip in and find hair-raising horrors and calamities on every page. In this fascinating guide to poisons, Celia Kellett provides information and entertainment in equal measure as she explains clearly what all the different poisons are and how they work, giving us all the gory detail of how, by accident or design, they have led to the demise of so many people. From cyanide to the Black Widow spider, and from the Green Mamba snake to botulism, poisons can be found everywhere from the jungle to the refrigerator. Did you know, for example, that the Emperor Napoleon died from arsenic poisoning caused by the green dye used for the

pattern on his wallpaper? Or that the Green Mamba's venom is so toxic that a bite is fatal within half an hour? Or that 50,000 people die from snake bites every year in India? Poison is rarely out of the headlines, with recent stories including the murder, by polonium poisoning, of Alexander Litvinenko in London, allegedly by the KGB, The Horse Whisperer author Nicholas Evans becoming seriously ill in Scotland after eating poisonous mushrooms, and melamine poisoning in Chinese baby-milk formula. It is a subject that holds a fascination for the general public who (along with budding crime writers, and perhaps the KGB) will want to buy this excellent book in large numbers.

principles based on the scientific evidence to date. The monographs cover commonly used essential oils and their therapeutic uses, details of toxicity, bioactivity, contraindications and clinical studies. This book provides pharmacists, GPs, nurses and other healthcare professionals with reliable scientifically based information on this growing discipline.

### **Making Medicines**

This is a concise study guide and thorough introduction to clinical pharmacology from which students can gain a rapid understanding of individual topics within the discipline, and from which they can review and revise certain topics before exams. This is achieved through self-contained two-page "spreads" for each topic, with concise text on the left and a diagram on the right to elaborate and reinforce the text. To further underpin the text, additional two page spreads have been included where appropriate, with case histories on the left and Q&As on the right. The text has a strong clinical focus and, in the main, sections relate to particular body systems or the therapy of a disease-class (eg, cancer).

Pharmacological principles and mechanisms are covered, but the main focus is on the therapeutic use of the drugs. Sections cover basic principles of pharmacology, specialised pharmacology (inc. in pregnancy, paediatrics, geriatrics), and the vitamins. The text has been written primarily for pharmacy students, but will also be of interest to clinical medical students. The strong clinical focus should also appeal to practitioners.
