Printing and imaging has a major impact on everyone. From the obvious examples

of newspapers, magazines and comics through to photographs, currency and credit cards, and even the less obvious example of compact discs, everyone is familiar with the end products of printing and imaging. Until recently, the major printing and imaging technologies have been impact printing and silver halide photography. Important impact printing technologies are offset lithography, gravure, flexography and screen printing. All these technologies, including silver halide photography, are mature and have changed little over the past few decades. In contrast, the phenomenal growth of silicon chip technology over the past 15 years or so has spawned a new era of printing and imaging systems, the so-called non impact (or electronic) printers. Not all the non-impact printing technologies are of equal commercial importance. Some, like diazotype and conventional photolithography, are mature and are declining in importance. Other technologies, though relatively new, have not achieved notable commercial success. Electrography and magnetography fall into this category. The remaining technologies such as optical data storage (the technology used in compact discs), thermography (the technology used in electronic photography), ink jet printing and electrophotography are the non-impact printing technologies that are both modern and which have achieved remarkable commercial success, especially ink-jet printing and electrophotography.

The fetal period of human growth and development has become an area of intense study in recent years, due in large part to the development of diagnostic ultrasound. More than 2,000 articles have been published in the last five years describing anatomy and pathology in utero, as reflected in sonographic images. Yet, no standard reference exists to correlate these images with fetal gross anatomy and attempts to draw parallels from adult structure have often led to false assumptions. The dictum "the newborn is not a miniature adult" is all the more valid for the fetus. This text aims to provide a comprehensive reference for normal sectional anatomy correlated with in utero ultrasound images. In addition, magnetic resonance images of therapeutically aborted or stillborn fetuses are paired with similar gross sections to serve as a foundation upon which current in vivo studies may build. Lastly, a miscellaneous section illustrates several anatomic points useful in the understanding of fetal anatomy. These points include the changing anatomy of the fetal brain during gestation and the anatomy of the

meninges, the fetal heart, and ductus venosus. It is our hope that this atlas will provide a clear picture of fetal anatomy, rectify some of the confusion which exists in antenatal diagnosis, and stimulate further interest in fetal development.

Chemistry and Technology of Printing and Imaging Systems

The organizers of this Sixth Symposium maintained their initial objectives, namely to gather experts from both industries and universities to discuss the scientific problems involved in the preparation of heterogeneous catalysts, and to encourage as much as possible the presentation of research work on catalysts of real industrial significance. Another highlight of these symposia is to reserve a substantial part of the program to new developments in catalyst preparation, new preparation methods and new catalytic systems. The fact that chemical reactions which were hardly conceivable some years ago have become possible today through the development of appropriate catalytic systems proves that catalysis is

in constant progress. The papers in this volume deal with preparation of new catalysts and supports, catalyst preparation via sol-gel methods, supported catalysts and synthesis of nanometer size catalysts.

There is growing enthusiasm for the use of mediation to seek to resolve cases arising under the Hague Convention of 25 October 1980 on the Civil Aspects of International Child Abduction (the Convention). However, despite being endorsed

by the conclusions of meetings of experts, judicial comment and even legislative changes, there have been relatively few cases where mediation has played a significant role. It is suggested that the reason underlying this dichotomy between the widespread support for the use of mediation and the current limited practice is that there are several key questions regarding the use of mediation in the context of the Convention which remain to be answered. Specifically: what is meant by Convention mediation? How can a mediation process fit within the constraints of the Convention? And why offer mediation in Convention cases given the existing legal framework? This book addresses these questions and in so doing seeks to encourage a movement from enthusiasm about the use of mediation in the Convention context to greater practice.

Joints and Connective Tissues - General Practice: The Integrative Approach Series. In order to diagnose and manage the patient presenting with musculoskeletal symptoms, it is important to distinguish whether the pathology is arising primarily in the so-called hard tissues (such as bone) or the soft tissues (such as cartilage, disc, synovium, capsule, muscle, tendon, tendon sheath). It is also important to distinguish between the two most common causes of musculoskeletal symptoms, namely inflammatory and degenerative.

Neuropathology, Volume IV presents the proceedings of the First International Congress of Neurological Sciences, held in Brussels, Belgium, on July 21–28, 1957. This book provides information pertinent to the fundamental aspects of neuropathology. Organized into 84 chapters, this compilation of papers begins with an overview of the problem of multiple sclerosis and its relationship to leucodystrophies. This text then explains the two major histopathological manifestations of the injury caused by the rabies virus in the central nervous system. Other chapters consider the successful identification and isolation of a biologically active compound, which depends to a large extent on the availability of a quantitative bioassay. This book discusses as well the clinical manifestations,

pathogenesis, and treatment of multiple sclerosis. The final chapter deals with the study of nucleic acids as well as histochemistry as a method of histological inquiry. This book is a valuable resource for neuropsychiatrists, biochemists, physicians, and scientists.

The concept of police and crime commissioners is still very much on probation. Some Commissioners have fallen well short of the public's expectations and urgent reforms are needed to ensure that this concept does not put at risk public trust and engagement in the police, the very objectives for which PCCs were brought in. New Commissioners should have a transition period of one month between election and taking office. The hiring of deputies and the decision to remove chief constables are critical decisions for local communities and it is vital that the amount of the scrutiny applied to commissioners by police and crime panels increases. Panels' powers must be strengthened and extended to ensure that any decision to remove a chief constable is the right one for the public. Only this will provide full public confidence. Deputies should not be cronies that are given their job on the basis of nepotism. Panels should have the power of veto over the appointment of a deputy commissioner, where they have not stood for election alongside the commissioner. By electing Deputies on the same ticket we ensure that the public will be able to have their say on someone who often acts with the powers of the Commissioner. Though good working relationships between chief constables and PCCs are welcomed, the arrangement should never be too cosy. The setting of targets by PCCs must not promote the manipulation of crime figures and all PCCs should review their auditing arrangements immediately
