Current Trends and Future Developments in (Bio-) Membranes: Cogeneration

Systems and Membrane Technology offers an exhaustive overview of the status of cogeneration systems as they relate to advanced membrane technologies for energy savings. The different options for cogeneration are analyzed, both for large (district) and small (residential) size units, with different primary fuels. Energy efficiency is reported and lifecycle analysis is carried out for all different options. The book outlines strategies for engineering development and process intensification of interest to both industrial and developing countries. Finally, the book includes three chapters on lifecycle analysis (LCA) and economic analysis. Provides an overview of the interconnections between membrane technology and the systems used for the cogeneration of electricity, such as exhaust gas cleaning, carbon capture and sequestration, and low temperature fuel cells Includes two different studies on LCA and a case study on economic analysis Presents comprehensive reviews on various traditional cogeneration systems and compares them to alternative membrane-based technologies Covers membrane based technologies and their application in co-generation systems Addresses key issues on the introduction of process intensification in energy production

For advanced undergraduates or graduates.

Transactions of the American Ceramic Society Containing the Papers and Discussions of the Annual Meeting

The second edition of a modern introduction to the chemistry and physics of solids. This textbook takes a unique integrated approach designed to appeal to both science and engineering students. Review of 1st edition “an extremely wide-ranging, useful book that is accessible to anyone with a firm grasp of high school science...this is an outstanding and affordable resource for the lifelong learner or current student.” Choice, 2005 The book provides an introduction to the chemistry and physics of solids that acts as a foundation to courses in materials science, engineering, chemistry, and physics. It is equally accessible to both engineers and scientists, through its more scientific approach, whilst still covering the material essential to engineers. This edition contains new sections on the use of computing methods to solve materials problems and has been thoroughly updated to include the many developments and advances made in the past 10 years, e.g. batteries, solar cells, lighting technology, lasers, graphene and graphene electronics, carbon nanotubes, and the Fukushima nuclear disaster. The book is carefully structured into self-contained bite-sized chapters to enhance student understanding and questions have been designed to reinforce the concepts

presented. The supplementary website includes Powerpoint slides and a host of additional problems and solutions.
